"The holographic Pomeron and Regge regime scattering"

Sophia Domokos, New York University

I will discuss Regge regime scattering using holographic QCD. While most holographic QCD models are confined to low-energy data, the Regge regime provides a wealth of additional data which can be used to test holographic techniques. This regime, however, requires us to push beyond the supergravity limit of the holographic models, and include stringy physics. I will describe a way to approximate stringy holographic scattering, focusing especially on Pomeron exchange.
